

COSMETIC COMPOSITIONS

Technical Field

The invention is in the field of cosmetic compositions.

5

Background of the Invention

Cosmetic compositions are generally defined as compositions suitable for application to the human body. Pigmented cosmetic compositions such as makeup, blush, lipstick, and eyeshadow are used to color the skin and lips, or to moisturize, hide wrinkles, and the like. Since color is one of the most important reasons for wearing cosmetics, color containing cosmetics must be very carefully formulated to provide maximum wear and effect.

10

Lipsticks are worn by most women. Generally if a woman wears any colored cosmetic composition at all it is lipstick. There are generally two types of lipstick. The first type is generally a combination of waxes, high viscosity oils, and pigments. These lipsticks provide varying degrees of shine and moisture to the lips due to the high oil content. However, these types of lipsticks are easily removed from the lips when the lips are touched with tissue, drinking vessels, tableware, or other skin surfaces. Thus, they must be frequently reapplied. The second type of lipsticks are the transfer resistant lipsticks such as those disclosed in U.S. patent no. 5,505,937, which is hereby incorporated by reference. Such lipsticks were commercially introduced several years ago. Transfer resistant lipsticks are generally comprised of some type of volatile solvent in place of at least a portion of the high viscosity oil, in addition to waxes, pigments and other ingredients. Transfer resistant lipsticks adhere extremely well to the lips and are not readily removed by eating, drinking, and the like. Thus, frequent reapplication is not

15

20

necessary and the wearer can apply the lipstick and be sure that it will stay on for a substantial period of time before wearing off.

Interestingly enough, the majority of women prefer lipsticks that provide a shiny finish to the lips. Shine is believed by some to provide a very youthful appearance that is associated with health and well-being. However, in lipsticks, a shiny finish is usually achieved with oils, in particular, high viscosity oils. It is not always desirable to incorporate shine-enhancing levels of oil into lipstick. Incorporating high amounts of oil in the standard non-transfer resistant lipsticks, at some point compromises stick structure and provides a very greasy feel on the lips. With respect to the transfer resistant lipsticks, incorporating shine-enhancing amounts of high viscosity oils compromises transfer resistance. Thus, it appears that shine is achieved at the expense of other desirable properties such as stick structure, feel on the lips, and transfer resistance.

Therefore, there is a need for a cosmetic stick composition such as lipstick, which provides a shiny finish on the lips and at the same time does not compromise feel, stick integrity, and transfer resistance.

It is an object of the invention to provide a cosmetic composition that provides a shiny finish on the skin.

It is an object of the invention to provide a lipstick composition that provides a shiny finish on the lips as well as excellent stick structure and suitable feel.

It is an object of the invention to provide a transfer resistant lipstick composition that provides a shiny finish on the lips without compromising transfer resistance.

It is an object of the invention to provide a method for improving the shine of a finish provided by a transfer resistant lipstick which is applied to the lips, comprising adding to the lipstick a shine enhancing effective amount of a polymer having a specified glass transition temperature.

5

Summary of the Invention

The invention is directed to a color cosmetic composition comprising an oil component and a particulate matter component, the improvement wherein the composition additionally contains an uncrosslinked synthetic polymer having a glass transition temperature of 76 to 120° C., comprising at least one methacrylate ester monomer repeat unit which, if polymerized, would yield a polymer having a glass transition temperature of 76 to 120° C.

10

Detailed Description

The cosmetic compositions of the invention are cosmetics for application to the skin or lips. Preferably, the cosmetic compositions of the invention are in the form of sticks. The term "stick" refers to cosmetic compositions having a consistency such that they can be molded into the form of a stick -- for instance by being heated until molten and then poured into a mold and cooled. Also included within the definition of "stick" are anhydrous compositions of the invention that are capable of being formed into sticks, but are poured into pans or other types of cake or cream forms to deliver certain consumer benefits. For example, an eyeshadow composition in accordance with the invention may be molded in the stick form, but it may be desired to pour it into a pan because this container is more desirable from a consumer standpoint. Preferably, the cosmetic sticks of the invention are anhydrous, although they may contain varying amounts of water. The term "anhydrous" means that the composition contains

15

20

no more than about 5 percent, more particularly about 1 to 2 percent by weight or less of water, or more preferably, that water is not intentionally added to the cosmetic composition of the invention. All percentages mentioned herein are percentages by weight unless otherwise indicated. All percentages stated herein are percentages by weight unless otherwise indicated.

5 THE POLYMER

The polymer of the invention is an uncrosslinked synthetic polymer having a glass transition temperature of 76 to 120° C., comprising at least one methacrylate ester monomer repeat unit which, if polymerized, would yield a polymer having a glass transition temperature 76 to 120° C.

10 The term "glass transition temperature" means the temperature at which an amorphous material such as glass or a high polymer changes from a brittle, vitreous state to a plastic state. With respect to acrylics and acrylates, the glass transition temperature generally correlates with the number of carbon atoms in the ester group, i.e. the greater the number of carbon atoms the lower the glass transition temperature. The glass transition temperature of a polymer may be
15 theoretically calculated according to the following formula:

$$\frac{1}{T_g} = \frac{W_1}{T_{g1}} + \frac{W_2}{T_{g2}} + \frac{W_3}{T_{g3}} + \dots + \frac{W_n}{T_{gn}}$$

where T_g is the glass transition temperature of the polymer in degrees Kelvin; W₁, W₂, W₃.....W_n
20 are the weight fractions of each of the components of the polymer, and T_{g1}, T_{g2}, T_{g3}, and T_{gn} are the T_g in degrees Kelvin, of the homopolymer [Reference: T.G. Fox, Bull. Am. Phys. Soc., No. 3, page 123 (1956)]. A more practical way, and the preferred way, to measure T_g is by differential scanning calorimetry (DSC) which measures the change in the enthalpy of a polymer

with temperature. Preferably, DSC is used to measure the Tg of polymers used in the compositions of the invention.

The term "repeat unit" means a monomer unit of the polymer which is present more than one time in the polymer chain, and it can be present in either repetitive sequence or in random
5 sequence with the other monomer units.

The final polymer may be a homopolymer, copolymer, terpolymer, or graft or block copolymer, and may contain, in addition to the repeat unit, other monomeric units such as styrene, ethylenically unsaturated monomer units such as ethylene, propylene, butylene, etc., vinyl monomers such as vinyl chloride, styrene, silicon repeat units, and so on, provided that the
10 final polymer has a glass transition temperature of 76 to 120° C., and has at least one repeat unit which, if polymerized, preferably to a molecular weight average of 20,000, would yield a glass transition temperature of 76 to 120° C. Preferably the polymer is a homopolymer.

The compositions of the invention comprise 0.1-60%, preferably 1-40%, more preferably 3-30% of the polymer.

15 A variety of methacrylate ester monomer repeat units may be used to make the polymer, including aliphatic esters of methacrylic acid like those obtained with the esterification of methacrylic acid with an aliphatic alcohol of 1 to 30, preferably 2 to 20, more preferably 2 to 8 carbon atoms. If desired, the aliphatic alcohol may have one or more hydroxy groups. Also suitable are methacrylate ester monomer repeat units esterified with moieties containing alicyclic
20 or bicyclic rings such as cyclohexyl or isobornyl, for example.

Preferably, the polymer is made from ethylenically unsaturated monomer repeat units having the the following general formula:

wherein R_1 is COOM wherein M is a substituted or unsubstituted C_{1-30} straight or branched chain alkyl where the substituents are halogen or alkoxy; pyrrolidone; or a substituted or unsubstituted aromatic, cyclic, alicyclic, or bicyclic ring where the substituents are C_{1-30} straight or branched alkyl.

Preferably, R_1 is COOM where M is a C_{1-30} alkyl or a alicyclic or bicyclic ring, more preferably a C_{1-5} alkyl or an alicyclic ring, and most preferably methyl or an alicyclic ring which is isobornyl.

Preferably the polymer used in the compositions of the invention has a glass transition temperature of $80-115^\circ \text{C}$., more preferably $90-110^\circ \text{C}$., and is comprised of at least one repeat unit which, if polymerized to a molecular weight average of about 20,000, has a glass transition temperature of about $80-115^\circ \text{C}$., more preferably $90-110^\circ \text{C}$.; and has a molecular weight of about 5,000 to 300,000, preferably 5,000 to 50,000.

The polymer used in the compositions of the invention may be soluble in solvents, or capable of forming stable dispersions and/or emulsions in such solvents. Preferably the polymer used in the compositions of the invention is soluble in solvents such as paraffinic hydrocarbons, particularly isododecane. Most preferably, the polymer is in the form of a solution comprising 1-90% by weight polymer and 10-99% by weight solvent where the solvent is preferably a paraffinic hydrocarbon, most preferably isododecane.

Examples of suitable monomer units which may be used to make the polymers used in the compositions of the invention include, but are not limited to, those set forth below:

homopolymer T_g^o C.

5	methyl methacrylate	105
	isobornyl methacrylate	105
	chloroethylmethacrylate	103
	isopropyl methacrylate	81
	phenyl methacrylate	105

10

The polymers used in the compositions of the invention can be prepared by conventional free radical polymerization techniques in which the monomer, solvent, and polymerization initiator are charged over a 1-24 hour period of time, preferably 2-8 hours, into a conventional polymerization reactor in which the constituents are heated to about 60-175° C., preferably 80-

15

100° C. The polymers may also be made by emulsion polymerization or suspension polymerization using conventional techniques. Also anionic polymerization or Group Transfer Polymerization (GTP) is another method by which the copolymers used in the invention may be

20

made. GTP is well known in the art and disclosed in U.S. Patent Nos. 4,414,372; 4,417,034; 4,508,880; 4,524,196; 4,581,428; 4,588,795; 4,598,161; 4,605,716; 4,605,716; 4,622,372;

25

4,656,233; 4,711,942; 4,681,918; and 4,822,859; all of which are hereby incorporated by reference. The preferred polymers for use in the compositions of the invention, including isobornylmethacrylate, were made by GTP in accordance with the methods disclosed in U.S. Patent No.s 4,588,795 and 4,605,716.

OIL

25

The compositions of the invention contain 1-60%, preferably 10-50%, more preferably 10-40% oil. The oils used may be volatile or nonvolatile. The term "volatile" means that the oil

has a measureable vapor pressure, or a vapor pressure of at least 2 mm. of mercury at 20° C. The term "nonvolatile" means that the oil has a vapor pressure of less than 2 mm. of mercury at 20°

C. If the cosmetic compositions of the invention are transfer resistant sticks, it is desirable to use significant amounts of volatile solvent for the oil component. Suitable volatile solvents or
5 oils are liquids, and enable easy formulation of the cosmetic stick of the invention. When the cosmetic stick product of the invention is applied to skin or lips, the volatile solvent of the invention must be capable of flashing off to leave the other ingredients in the stick on the skin. Suitable volatile solvents generally have a viscosity of 0.5 to 10 centistokes at 25° C. Suitable volatile oils include linear silicones, cyclic silicones, paraffinic hydrocarbons, or mixtures

10 thereof.

Cyclic silicones (or cyclomethicones) are of the general formula:

wherein R_1 and R_2 are each independently H, C_{1-8} alkyl, aryl, aralkyl, alkenyl, or a cyclic or
20 alicyclic ring, preferably a C_{1-4} alkyl, most preferably methyl, and wherein $n = 3-7$.

Linear volatile silicones in accordance with the invention have the general formula:

where $n=0-7$, preferably 0-5.

Linear and cyclic volatile silicones are available from various commercial sources including Dow Corning Corporation and General Electric. The Dow Corning volatile silicones are sold under the tradenames Dow Corning 244, 245, 344, and 200 fluids. These fluids comprise octamethylcyclotetrasiloxane, decamethylcyclopentasiloxane, hexamethyldisiloxane, and mixtures thereof.

Also suitable as the volatile oils are various straight or branched chain paraffinic hydrocarbons having 5 to 40 carbon atoms, more preferably 8-20 carbon atoms. Suitable hydrocarbons include pentane, hexane, heptane, decane, dodecane, tetradecane, tridecane, and C₈₋₂₀ isoparaffins as disclosed in U.S. patent nos. 3,439,088 and 3,818,105, both of which are hereby incorporated by reference. Preferred volatile paraffinic hydrocarbons have a molecular weight of 70-225, preferably 160 to 190 and a boiling point range of 30 to 320, preferably 60-260 degrees C., and a viscosity of less than 10 cs. at 25 degrees C. Such paraffinic hydrocarbons are available from EXXON under the ISOPARS trademark, and from the Permethyl Corporation. Suitable C₁₂ isoparaffins are manufactured by Permethyl Corporation under the tradename Permethyl 99A. Another C₁₂ isoparaffin (isododecane) is distributed by Presperse under the tradename Permethyl 99A. Various C₁₆ isoparaffins commercially available, such as isohexadecane (having the tradename Permethyl R), are also suitable. Transfer resistant cosmetic sticks of the invention will generally comprise a mixture of volatile silicones and volatile paraffinic hydrocarbons.

A wide variety of nonvolatile oils are also suitable for use in the cosmetic compositions of the invention. The nonvolatile oils generally have a viscosity of greater than 10 centipoise at

25° C., and may range in viscosity up to 1,000,000 centipoise at 25° C. Examples of nonvolatile oils suitable for use in the cosmetic sticks of the invention include esters of the formula RCO-OR' wherein R and R' are each independently a C₁₋₂₅, preferably a C₄₋₂₀ straight or branched chain alkyl, alkenyl or alkoxy carbonyl alkyl or alkyl carbonyloxy alkyl. Examples of such esters include

5 isotridecyl isononanoate, PEG-4 diheptanoate, isostearyl neopentanoate, tridecyl neopentanoate, cetyl octanoate, cetyl palmitate, cetyl ricinoleate, cetyl stearate, cetyl myristate, coco-dicaprylate/caprate, decyl isostearate, isodecyl oleate, isodecyl neopentanoate, isohexyl neopentanoate, octyl palmitate, dioctyl malate, tridecyl octanoate, myristyl myristate, octododecanol, and fatty alcohols such as oleyl alcohol, isocetyl alcohol, and the like, as well as the
10 esters disclosed on pages 24-26 of the C.T.F.A. Cosmetic Ingredient Handbook, First Edition, 1988, which is hereby incorporated by reference.

The oil may also comprise naturally occurring glyceryl esters of fatty acids, or triglycerides. Both vegetable and animal sources may be used. Examples of such oils include castor oil, lanolin oil, triisocetyl citrate, C₁₀₋₁₈ triglycerides, caprylic/capric triglycerides, coconut oil, corn oil,
15 cottonseed oil, linseed oil, mink oil, olive oil, palm oil, illipe butter, rapeseed oil, soybean oil, sunflower seed oil, walnut oil, and the like.

Also suitable as the oil are synthetic or semi-synthetic glyceryl esters, e.g. fatty acid mono-, di-, and triglycerides which are natural fats, or oils that have been modified, for example, acetylated castor oil, glyceryl stearate, glyceryl dioleate, glyceryl distearate, glyceryl trioctanoate,
20 glyceryl distearate, glyceryl linoleate, glyceryl myristate, glyceryl isostearate, PEG castor oils, PEG glyceryl oleates, PEG glyceryl stearates, PEG glyceryl tallowates, and so on.

Also suitable as the oil are nonvolatile hydrocarbons such as isoparaffins, hydrogenated polyisobutene, mineral oil, squalene, petrolatum, and so on.

Straight or branched chain fatty alcohols having the formula R-OH, wherein R is a straight or branched chain saturated or unsaturated alkyl having 6-30 carbon atoms, are also suitable oils.

- 5 Such fatty alcohols include cetyl alcohol, stearyl alcohol, cetearyl alcohol, and the like.

Also suitable as the oil are various lanolin derivatives such as acetylated lanolin, acetylated lanolin alcohol, and so on.

- Nonvolatile silicones, both water soluble and water insoluble, are also suitable as the oil component. Such silicones preferably have a viscosity of 10 to 600,000 centistokes, preferably 20
10 to 100,000 centistokes at 25° C. Suitable water insoluble silicones include amodimethicone, bisphenylhexamethicone, dimethicone, hexadecyl methicone, methicone, phenyl trimethicone, simethicone, dimethylhydrogensiloxane, stearoxytrimethylsilane, vinyl dimethicone, and mixtures thereof. Also suitable are water soluble silicones such as dimethicone copolyol, dimethiconol, and the like. Such silicones are available from Dow Corning as the 3225C formulation aid, Dow 190
15 and 193 fluids, or similar products marketed by Goldschmidt under the ABIL tradename.

- Also suitable as the nonvolatile oil are various fluorinated oils such as fluorinated silicones, fluorinated esters, or perfluoropolyethers. Particularly suitable are fluorosilicones such as trimethylsilyl endcapped fluorosilicone oil, polytrifluoropropylmethoxysiloxanes, and similar silicones such as those disclosed in U.S. patent no. 5,118,496 which is hereby incorporated by
20 reference. Perfluoropolyethers like those disclosed in U.S. patent nos. 5,183,589, 4,803,067, 5,183,588 all of which are hereby incorporated by reference, which are commercially available from Montefluos under the trademark Fomblin, are also suitable shine enhancers.

Guerbet esters are also suitable oils. The term "guerbet ester" means an ester which is formed by the reaction of a guerbet alcohol having the general formula:

with a carboxylic acid having the general formula:

wherein R^1 and R^2 are each independently a C_{4-20} alkyl and R^3 is a substituted or unsubstituted fatty radical such as a C_{1-50} straight or branched chain saturated or unsaturated alkyl or alkylene, or phenyl, wherein the substituents are halogen, hydroxyl, carboxyl, and alkylcarbonylhydroxy. Particularly preferred is a carboxylic acid wherein the R group is such to provide an ingredient known as meadowfoam seed oil.

Preferably, the guerbet ester is a fluoro-guerbet ester which is formed by the reaction of a guerbet alcohol and carboxylic acid (as defined above), and a fluoroalcohol having the following general formula:

wherein n is from 3 to 40.

Examples of suitable fluoro guerbet esters are set forth in U.S. patent no. 5,488,121 which is hereby incorporated by reference. Suitable fluoro-guerbet esters are also set forth in U.S. patent

no. 5,312,968 which is hereby incorporated by reference. Most preferred is a guerbet ester having the tentative CTFA name fluoro-octyldodecyl meadowfoamate. This ester is sold by Siltech, Norcross Georgia as Developmental Ester L61125A, under the tradename Silube GME-F.

5 Preferably, the compositions of the invention contain a mixture of volatile and nonvolatile oils, so that the amount of volatile oil is about 1-50%, preferably 5-40%, more preferably 10-30% by weight of the total composition, and the amount of nonvolatile oil is about 1-50%, preferably 5-40%, more preferably 10-30% by weight of the total composition. In the preferred embodiment of the invention, the volatile oils are cyclomethicone and isododecane, and the preferred nonvolatile
10 oil is dimethicone and fluoro octyldodecylmeadowfoamate.

PARTICULATE MATTER

The composition of the invention may contain 1-50%, preferably 7-45%, more preferably 10-40%, by weight of the total composition, of particulate matter having a particle size of 0.02 to 100, preferably 0.5 to 100, microns. The particulate matter may be colored or non-colored (for
15 example white). Suitable particulates include bismuth oxychloride, titanated mica, fumed silica, spherical silica, polymethylmethacrylate, polyethylene, polypropylene, micronized teflon, boron nitride, acrylate copolymers, aluminum silicate, aluminum starch octenylsuccinate, bentonite, calcium silicate, cellulose, chalk, corn starch, diatomaceous earth, fuller's earth, glyceryl starch, hectorite, hydrated silica, kaolin, magnesium aluminum silicate, magnesium trisilicate,
20 maltodextrin, montmorillonite, microcrystalline cellulose, rice starch, silica, talc, mica, titanium dioxide, zinc laurate, zinc myristate, zinc rosinate, alumina, attapulgite, calcium carbonate, calcium silicate, dextran, kaolin, nylon, silica silylate, silk powder, sericite, soy flour, tin oxide,

titanium hydroxide, trimagnesium phosphate, walnut shell powder, or mixtures thereof. The above mentioned powders may be surface treated with lecithin, amino acids, mineral oil, silicone oil or various other agents either alone or in combination, which coat the powder surface and render the particles more lipophilic in nature.

5 The particulates may also include various organic and inorganic pigments. The organic pigments are generally various aromatic types including azo, indigoid, triphenylmethane, anthraquinone, and xanthine dyes which are designated as D&C and FD&C blues, browns, greens, oranges, reds, yellows, etc. Organic pigments generally consist of insoluble metallic salts of certified color additives, referred to as the Lakes, in particular the Lakes of D&C and FD&C
10 colors. Inorganic pigments include iron oxides, ultramarines, chromium, chromium hydroxide colors, and mixtures thereof.

 Preferably the composition will contain both pigmented and non-pigmented particulates. Obviously the percentage of pigments used in the particulate phase will depend on the type of cosmetic being formulated. Color cosmetics generally have a much higher concentration of color
15 than other types of cosmetics. Generally the weight ratio of pigmented to non-pigmented particulates range from 1:50 to 50:1. It should be noted that particulates that are white or have no color are considered non-pigmented particulates in accordance with the invention, while particulates which exhibit color other than white are considered pigmented particulates in accordance with the invention.

20 OTHER INGREDIENTS

Wax

Preferably, the cosmetic compositions of the invention generally contain from about 1-70%, preferably 1-30%, more preferably 1-25% by weight of a cosmetically acceptable natural or synthetic wax. The waxes that can be used are solid or semi-solid waxes having a melting point of 30 to 120° C. and generally includes animal waxes, plant waxes, mineral waxes, silicone waxes, synthetic waxes, and petroleum waxes.

Examples of waxes in accordance with the invention include bayberry, beeswax, candelilla, carnauba, ceresin, cetyl esters, hydrogenated jojoba oil, hydrogenated jojoba wax, hydrogenated microcrystalline wax, hydrogenated rice bran wax, japan wax, jojoba butter, jojoba esters, jojoba wax, lanolin wax, microcrystalline wax, mink wax, montan acid wax, montan wax, ouricury wax, ozokerite, paraffin, PEG-6 beeswax, PEG-8 beeswax, rice bran wax, shellac wax, spent grain wax, sulfurized jojoba oil, synthetic beeswax, synthetic candelilla wax, synthetic carnauba wax, synthetic japan wax, synthetic jojoba oil, synthetic wax, stearoxy dimethicone, dimethicone behenate, stearyl dimethicone, and the like, as well synthetic homo- and copolymer waxes from the ethylene series. In the preferred embodiment of the invention the waxes are polymers of ethylene and/or propylene.

Preferably, the composition of the invention contain fluorinated waxes, either alone or in addition to the above-mentioned natural or synthetic waxes. Particularly preferred are fluorinated dimethicone copolyols disclosed in U.S. Patent No. 5,446,114, which is hereby incorporated by reference, having the general formula:

wherein:

p is an integer ranging from 1 to 2,000;

Me is methyl;

R' is $-(CH_2)_3-O-(EO)_a-(PO)_b-(EO)_c-H$;

5 R is $-(CH_2)_2-(CF_2)_s-CF_3$;

s is an integer ranging from 1 to 13;

a, b, and c are each independently integers ranging from 0 to 20;

EO is $-(CH_2CH_2-O)-$; and

PO is $-(CH_2CH(CH_3)-O)-$.

10 Particularly preferred is a compound, dimethiconol fluoroalcohol dilinoleic acid, which is sold by Siltech, Inc., under the tradename Silwax F.

Shine Enhancers

It may be desirable to include other ingredients in the formulation, in particular certain ingredients which enhance shine of the finish provided by the cosmetic composition of the invention. About 5-60%, preferably 5-50%, more preferably 7-45% of shine enhancers are suggested. Examples of shine enhancing ingredients are homo- or copolymers which are clear, or in other words have an index of refraction of 1.5 or greater. Examples of clear polymers are alkylated polyvinylpyrrolidones sold by International Specialty Products under the GANEX tradename. These polymers are copolymers of vinylpyrrolidone and long chain alpha olefins, and

20 have the following general formula:

wherein R is H or a C₁₋₄₀ straight or branched chain alkyl, preferably a C₆₋₂₂ straight or branched chain alkyl. Examples of such polymers are disclosed in U.S. patent nos. 4,514,271, 3,423,381, 3,423,381, and 3,417,054, all of which are hereby incorporated by reference. The composition preferably comprises 0.5-35%, preferably 1-20%, more preferably 1-15% of a C₆₋₂₂ alkylated polyvinylpyrrolidone. Particularly preferred are PVP/eicosene copolymer and PVP/hexadecene copolymer, and in particular PVP/eicosene copolymer.

Also suitable are polyvinylpyrrolidone (PVP) homopolymers, which may be purchased from International Special Products under the PVP-K tradename, in particular PVP K-15, PVP K-30, PVP K-60, PVP K-90, PVP K-120.

PVP/acetate copolymers, which are copolymers of vinylpyrrolidone and vinylacetate, are also suitable shine enhancers. Such polymers are sold under the PVP/VA tradename by International Specialty Products.

Also suitable shine enhancers are monoalkyl esters of poly(methylvinyl ether/maleic acid), which are sold by International Specialty Products under the GANTREZ tradename.

It may also be desired to add other ingredients such as preservatives, antioxidants, vitamins, emulsifiers, and the like.

5 The preferred cosmetic compositions of the invention are cosmetic sticks comprising:

3-30% of the polymer,

10-40% of a volatile oil, preferably cyclomethicone, a volatile paraffinic hydrocarbon, or mixtures thereof;

10-30% of a nonvolatile oil, preferably dimethicone, fluoro guerbet ester, or mixtures thereof;

1-30% of a wax having a melting point of 30 to 120° C., preferably a synthetic wax which is an aliphatic hydrocarbon, a fluorinated wax, or mixtures thereof; and

10-40% particulate matter having a particle size of 0.5 to 100 microns.

Most preferably, the composition additionally contains 7-45% shine enhancers,

15 preferably one or more homo- or copolymers having an index of refraction of 1.5 or greater.

The invention will be further described in connection with the following examples which are set forth for the purpose of illustration only.

EXAMPLE 1

A lipstick was made as follows:

20	<u>w/w%</u>
	1
Synthetic hydrocarbon	3.50
Fluoro octyldodecylmeadowfoamate	5.00
Diisopropyl sebacate	4.00

	Trioctyldodecyl citrate	3.00
	Synthetic wax	8.00
	Methyl paraben	0.30
	Propyl paraben	0.10
5	BHA	0.10
	Vitamin E acetate	0.10
	Mica, silica	10..3
	Mica, bismuth oxychloride	7.0
	Isododecane	27.0
10	Poly(isobornyl methacrylate)*	20.0
	33% D&C Red #7 in lanolin oil	9.3

* a solution containing about 48 parts by weight of isobornyl methacrylate and 52 parts by weight isododecane.

15

The poly(isobornyl methacrylate) solution was made by GTP polymerization in isododecane according to the procedure set forth in U.S. Patent nos. 4,588,795 and 4,605,716.

The polymer had a molecular weight of 19,900.

20 The lipstick composition was made by combining the oils, solids, and semi-solid materials with heat. The pigments, powders and other ingredients were added. The compositions were poured into stick molds and cooled.

While the invention has been described in connection with the preferred embodiment, it is not intended to limit the scope of the invention to the particular form set forth but, on the contrary, it is intended to cover such alternatives, modifications, and equivalents as may be
25 included within the spirit and scope of the invention as defined by the appended claims.
